

The simple and secure solution for your central access and rights management
 The Grenzebach Security Manager

DATA SHEET | SECURITY MANAGER

Due to its central access and rights management system, the Security Manager enables authorized users to set system and application-wide configurations. The Security Manager is based on the open source framework „Identity Server4“ and disposes of basic safety functions, such as the standards OpenID Connect and OAuth 2.0. The Security Manager thereby provides common methods to authenticate all your connected applications, and helps to prevent unauthorized access to data and programs.

Another core function of the Security Manager is the central user management with a configurable role and rights system including the consistent management of users, roles, and rights.

An optional connection to your Active Directory or the Active Directory Federation Service with Sigle-Sign-on is available.

The Security Manager provides these features and benefits:

Decentralization by transferring identities and authentication from client applications to the Security Manager.

Configurable role and rights system with consistent management of users and rights.

Creation of password configurations for individual roles with optional specification of password complexity.

Easy traceability of actions within the Security Manager.

Creation of backup files and restoring configurations and data.

Central access and rights management for all connected systems.
